

DPF and vehicle maintenance:

1211 1st East Humble, Texas 77338 832-543-8900

## Our Cleaning Method

There is an ongoing debate as to the proper way to service a dirty DPF.

It has been said that heat is not good for the DPF, it shortens the life of the filter. If that was the case, you would have to replace your DPF every month. The designer of your filter believe that heat is the best way to clean your filter. Your diesel operated vehicle performs what is called a regen hundreds of times during the life of your filter.

A regen cycle occurs essentially cooking the filter as clean as possible. During this cycle, the filter's temperature can exceed temperatures over 1000 degrees Fahrenheit.

Our filter cleaning service is performed using a oven designed for servicing the DPF. It cleans using controlled heat.

To dramatically reduce the required baking time, before baking the DPF, we perform what is called a aqueous wash, which produces the cleanest filter possible. We are the only filter servicing company in Harris county with the aqueous wash system.
